

Unending Water Cycle - How water (H_2O) moves through Earth and the atmosphere

- ① Evaporation: water changes from liquid to gas because of HEAT
- ② Condensation: water changes from gas to liquid because water COOLS
- ③ Precipitation: (rain, snow, sleet, hail) fall from clouds because of gravity

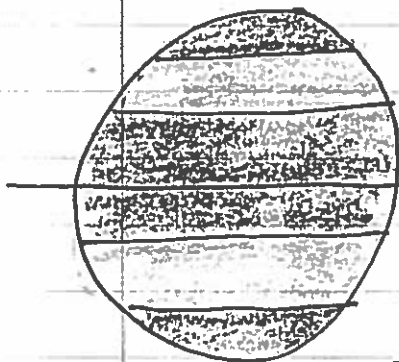

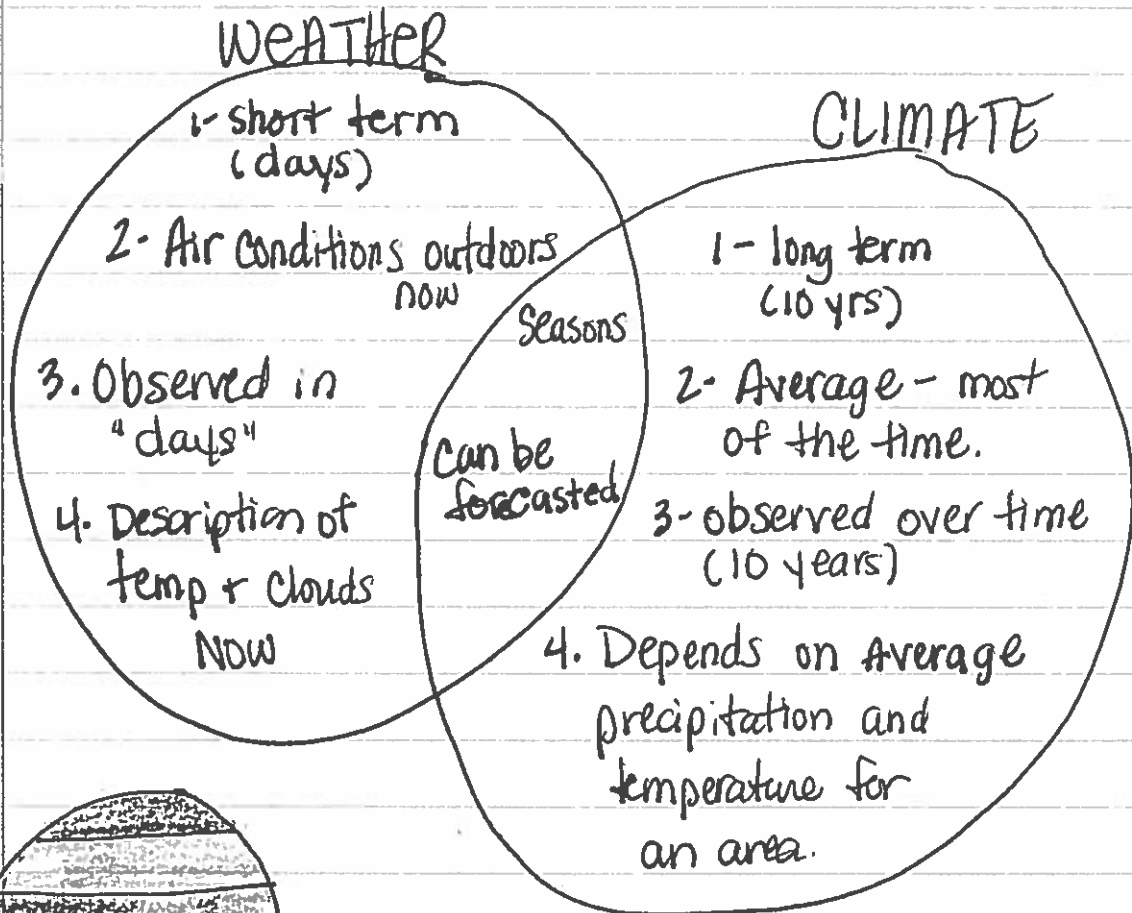

⑥ SUN - provides energy that heats ocean water and land to cause evaporation,
Ocean - largest body of water on Earth (salty)
Covers 75% of Earth's surface

All the water on Earth is recycled.

Humidity - the amount of water vapor in air.

equator

Polar - cold

Temperate - nice

Tropical - hot + wet
